## The Fibonacci Quilt Game

Alexandra Newlon<br>Colgate University anewlon@colgate.edu

Joint work with Neelima Borade, Catherine Wahlenmayer, and Wanqiao Xu. Mentored by Steven J. Miller.

REU Conference
University of Massachusetts Amherst, July 23, 2019

## Outline

(2) The Fibonacci Quilt Sequence
(3) The Game

4 Game Length
(5) Future Work

## The Fibonacci Sequence

$1,1,2,3,5,8,13,21,34,55 \ldots$

## The Fibonacci Sequence

$1,1,2,3,5,8,13,21,34,55 \ldots$
Let $F_{0}=F_{1}=1$, and for $n>=2$

$$
F_{n}=F_{n-1}+F_{n-2}
$$

## The Fibonacci Sequence

$$
1,1,2,3,5,8,13,21,34,55 \ldots
$$

Let $F_{0}=F_{1}=1$, and for $n>=2$

$$
F_{n}=F_{n-1}+F_{n-2}
$$

## Theorem (Zeckendorf)

Every positive integer can be written uniquely as the sum of non-consecutive Fibonacci numbers where

$$
F_{n}=F_{n-1}+F_{n-2}
$$

and $F_{1}=1, F_{2}=2$.

The Fibonacci Quilt Sequence

The Fibonacci Quilt Sequence

The Fibonacci Quilt Sequence

The Fibonacci Quilt Sequence

## The Fibonacci Quilt Sequence

## FQ-legal Decomposition

## Definition (Catral, Ford, Harris, Miller, Nelson)

Let an increasing sequence of positive integers $q_{i=1}^{\infty}$ be given. We declare a decomposition of an integer

$$
m=q_{t_{1}}+q_{t_{2}}+\cdots+q_{t_{t}}
$$

(where $q_{i j}>q_{l_{i+1}}$ ) to be an FQ-legal decomposition if for all $i, j$, $\left|l_{i}-I_{j}\right| \neq 0,1,3,4$ and $\{1,3\} \not \subset\left\{I_{1}, I_{2}, \ldots, I_{t}\right\}$.

## The Fibonacci Quilt Sequence

## Definition (Catral, Ford, Harris, Miller, Nelson)

The Fibonacci Quilt sequence is an increasing sequence of positive integers $\left\{q_{i}\right\}_{i=1}^{\infty}$, where every $q_{i}(i \geq 1)$ is the smallest positive integer that does not have an FQ-legal decomposition using the elements $\left\{q_{1}, \ldots, q_{i-1}\right\}$.

## Recurrence Relations

## Theorem (Catral, Ford, Harris, Miller, Nelson)

Let $q_{n}$ denote the $n^{\text {th }}$ term in the Fibonacci Quilt, then

$$
\begin{gathered}
\text { for } n \geq 5, q_{n+1}=q_{n-1}+q_{n-2}, \\
\text { for } n \geq 6, q_{n+1}=q_{n}+q_{n-4} .
\end{gathered}
$$

## General Rules

- Inspired by the Zeckendorf Game
- Two player game, alternate turns, last to move wins.
- Start with $n$ 1's ( $q_{1}$ 's)
- A turn is one of the following 4 general rules and some base rules.

## General Rules

- Inspired by the Zeckendorf Game
- Two player game, alternate turns, last to move wins.
- Start with $n$ 1's ( $q 1$ 's)
- A turn is one of the following 4 general rules and some base rules.

## Rule 1

$$
\text { For } n \geq 2, q_{n}+q_{n+1} \rightarrow q_{n+3}
$$

## General Rules

## Rule 2

For $n \geq 2, q_{n}+q_{n+4} \rightarrow q_{n+5}$

## General Rules

## Rule 3

For $n \geq 7,2 q_{n} \rightarrow q_{n+2}+q_{n-5}$

## Genereal Rules

Rule 4

$$
\text { For } n \geq 7, q_{n}+q_{n+3} \rightarrow q_{n-5}+q_{n+4}
$$

## Base Rules

To handle base cases, we added additional base rules that

- preserves the total number of pieces
- does not produce violation of legality

## Base Rules

To handle base cases, we added additional base rules that

- preserves the total number of pieces
- does not produce violation of legality

## Special Rule

$$
1+5 \rightarrow 2+4
$$

Note: This rule can only be applied when nothing else can be done.

## Example Game

$$
1,2,3,4,5,7,9,12,16,21,28 \ldots
$$

$\mathrm{n}=10=9+1$

| 1 | 2 | 3 | 4 | 5 | 7 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 10 | 0 | 0 | 0 | 0 | 0 | 0 |

## Example Game

$$
1,2,3,4,5,7,9,12,16,21,28 \ldots
$$

$\mathrm{n}=10=9+1$

| 1 | 2 | 3 | 4 | 5 | 7 | 9 |

## The Game is Playable

## Theorem

Every game terminates in a finite number of moves at an FQ-legal decomposition.

## The Game is Playable

## Theorem

Every game terminates in a finite number of moves at an FQ-legal decomposition.

Proof Sketch: The sum of the squares of the indices of the terms is a strict monovarient.

## The Game is Playable

## Theorem

Every game terminates in a finite number of moves at an FQ-legal decomposition.

Proof Sketch: The sum of the squares of the indices of the terms is a strict monovarient.

- $q_{n} \wedge q_{n+1} \longrightarrow q_{n+3}: \sqrt{n+3}-\sqrt{n}-\sqrt{n+1}<0$

## The Game is Playable

## Theorem

Every game terminates in a finite number of moves at an FQ-legal decomposition.

Proof Sketch: The sum of the squares of the indices of the terms is a strict monovarient.

- $q_{n} \wedge q_{n+1} \longrightarrow q_{n+3}: \sqrt{n+3}-\sqrt{n}-\sqrt{n+1}<0$
- $q_{n} \wedge q_{n+4} \longrightarrow q_{n+5}: \sqrt{n+5}-\sqrt{n}-\sqrt{n+4}<0$

## The Game is Playable

## Theorem

Every game terminates in a finite number of moves at an FQ-legal decomposition.

Proof Sketch: The sum of the squares of the indices of the terms is a strict monovarient.

- $q_{n} \wedge q_{n+1} \longrightarrow q_{n+3}: \sqrt{n+3}-\sqrt{n}-\sqrt{n+1}<0$
- $q_{n} \wedge q_{n+4} \longrightarrow q_{n+5}: \sqrt{n+5}-\sqrt{n}-\sqrt{n+4}<0$
- $2 q_{n} \longrightarrow q_{n+2} \wedge q_{n-5}: \sqrt{n+2}+\sqrt{n-5}-2 \sqrt{n}<0$

## The Game is Playable

## Theorem

Every game terminates in a finite number of moves at an FQ-legal decomposition.

Proof Sketch: The sum of the squares of the indices of the terms is a strict monovarient.

## Lower Bound on Game Length

## Notation

Let $L(n)$ denote the maximum number of terms in an FQ-legal decomposition of $n$. Let $l(n)$ denote the minimum number of terms in an FQ-legal deocomposition of $n$.

Examples:
$20=16+4=12+7+1$
$L(20)=3, I(20)=2$

## Lower Bound on Game Length

## Notation

Let $L(n)$ denote the maximum number of terms in an FQ-legal decomposition of $n$. Let $l(n)$ denote the minimum number of terms in an FQ-legal deocomposition of $n$.

Examples:
$20=16+4=12+7+1$
$L(20)=3, I(20)=2$
$50=49+1=28+16+4+2$
$L(50)=4, l(50)=2$

## Lower Bound on Game Length

## Theorem

The shortest possible game on n is completed in $n-L(n)$ moves.

## Lower Bound on Game Length

## Theorem

The shortest possible game on n is completed in $n-L(n)$ moves.

Proof Sketch: Induction on n.

## Lower Bound on Game Length

## Theorem

The shortest possible game on n is completed in $n-L(n)$ moves.

Proof Sketch: Induction on n.
If n is in the Fibonacci Quilt Sequence, denoted $q_{i}$

$$
q_{i-3}+q_{i-2}=q_{i}
$$

## Lower Bound on Game Length

## Theorem

The shortest possible game on n is completed in $n-L(n)$ moves.

Proof Sketch: Induction on n.
If n is in the Fibonacci Quilt Sequence, denoted $q_{i}$

$$
q_{i-3}+q_{i-2}=q_{i}
$$

If n is not in the sequence

$$
n=q_{i_{1}}+q_{i_{2}}+\cdots+q_{i_{L(n)}}
$$

Number of moves:

$$
\begin{gathered}
\left(q_{i_{1}}-1\right)+\left(q_{i_{2}}-1\right)+\cdots+\left(q_{i_{L(n)}}-1\right) \\
=\left(q_{i_{1}}+q_{i 2}+\cdots+q_{i_{L(n n}}\right)-L(n) \\
=n-L(n)
\end{gathered}
$$

## Distribution of Game Lengths

## Conjecture

The distribution of a random game length approaches Gaussian as n increases.

Figure: Distribution of 1000 games on $\mathrm{n}=60$

## Future Work

- Is there a deterministic game that always results in the lower bound?
- What patterns emerge
in the winner of certain deterministic games as n increases?
- Does either player have a winning strategy?
- Analogous result on the Zeckendorf Game shows that for $n>2$, player 2 has a winning strategy
